

Are you **Protected?** Is your fabric **Fire Retardant?**

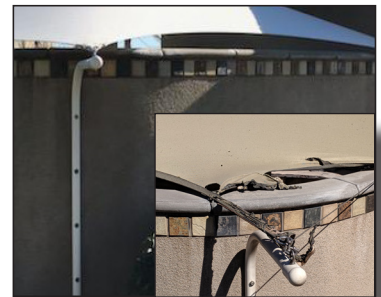

Dear Alnet Americas,

We have owned and loved our shade sails for 14 years. They protect my children, family, and friends from the sun's harmful rays as we enjoy our outdoor environment while also cooling the house through brutal 100+ degree summer days.

Recently, we experienced the fire we have feared for decades. Propelled by strong winds, it roared through the tinder-dry Southern California hillsides and blasted through our backyard like a blow torch. Our Alnet shade sails performed better than we could have imagined. The sails melted from the intense heat and wind but, amazingly, did not ignite. When the smoke cleared, the sails were pitted with holes evidence that the burning embers were caught and naturally extinguished on the sails, rather than landing on and igniting our home. There is no question in my mind that our sails helped to save our home.

Alnet's shade sail fabric protects my home and family on a daily basis. The desert sun, wind, rain, and now fire, beat and pummel our sails, yet they continue to perform no matter what Mother Nature throws at them!

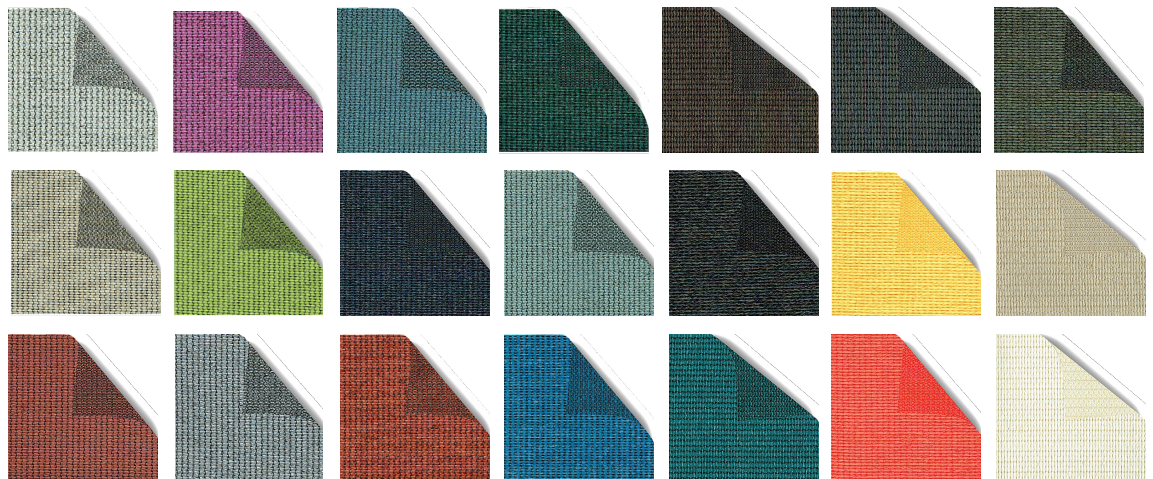

Sincerely,
Kelli Fuller
